

DIM15 + DIM10HP System Setup

- The DIM15 acts as the controller to the four slave DIM10HP dimmers.
- Each DIM10HP is fed from its own dedicated power supply and controls one of four banks of LEDs.
- Each DIM10HP is protected with its own fuse.
- The DIM15 is powered from any one of the power supplies and draws almost no power.
- Ensure the fixing tabs of the DIM10HP modules are securely bolted to a metal surface to help dissipate heat.
- All power supply negatives are connected together to form a common system earth.
